# 服务器配置说明

#### 总体架构概述

- 服务器描述+IP
  - server 1:114.55.9.239(DB + WEB)
  - server 2:121.43.37.254(WEB)
  - server 3:121.43.40.235(WEB)
- server 1的功能是数据库服务器和Web服务器,其余两台服务器是简单的Web服务器。
- Web: Api会判断接口的优先级高低,优先级高的直接入库。优先级低的,存入队列。后台慢慢消耗队列数据,然后存入MySQL。可以有效减小MySQL压力。
- 队列服务使用 httpsqs ,进程管理服务使用 supervisor 。
- 负载均衡: DNS轮询。

#### 软件环境:

#### php

- 目录: /usr/local/php/
- 配置文件: /usr/local/php/etc/php.ini,/usr/local/php-5.6.15/etc/php-fpm.conf

#### mysql:

- 安装目录: /usr/local/mysql/
- 数据目录: /data/mysql3306/---->由于更换磁盘,目录改为了/data\_new/mysql3306
- 账号密码: root, u591,hainiu\*
- 配置文件: /etc/my.cnf

#### nginx:

• 安装目录: /usr/local/nginx/

#### 程序目录:

/var/www/html/

发布程序,建议用deploy账号。

账号: deploy

密码: deploy@u591

#### 日志目录

注意: ,日志目录的权限,需要分配给nginx进程用户,如www用户。chown www:www /data/log/site -R

## 服务器使用的后台服务及详细介绍

• 队列服务:httpsqs

• 进程管理:supervisor

## 配置服务器自启动服务:

- /usr/bin/httpsqs -d -x /data/httpsqs/data -a u591
- /usr/bin/supervisord -c /etc/supervisord.conf
- /opt/openresty/nginx/sbin/nginx

#### logrotate

```
/data/log/web/*log {
    daily
    nocompress
    nomail
    copytruncate
    create
    missingok
    dateext
    notifempty
```

```
olddir /data/log/web/old
    size 50M
    postrotate
        /bin/kill -HUP `cat /var/run/nginx.pid 2> /dev/null` 2>
/dev/null || true
    endscript
}
```
